

Understanding Diabetes and Heart Failure

Heart failure is a condition when your heart muscle is weakened and it can't pump enough blood through your body.

You're at higher risk of developing heart failure if you live with diabetes.

Symptoms to Watch For

Symptoms of heart failure include:

-  Shortness of breath
-  Weakness
-  Nausea
-  Quick or irregular heartbeat
-  Coughing with pink-tinged mucus
-  Fatigue
-  Swelling of the feet and ankles (from fluid retention)

Early diagnosis and treatment can help you manage heart failure symptoms. Your doctor may use exams, blood tests, and heart imaging to diagnose heart failure.

How to Help Support a Healthy Heart

- Get daily physical activity
- Choose foods with less sodium
- Manage weight
- Stop smoking, vaping, or using e-cigarettes

• Talk to your healthcare team about how to support your heart health with diabetes and how your treatment plan can help manage heart failure and meet your health goals.
